

How do I check my SPD surge protective device?

To check your Surge Protective Device (SPD) in your fuse board or consumer unit, you can follow these steps:

1. Locate the SPD in your consumer unit. It is usually installed between the outside feed and the main switch ¹.
2. Check if the SPD is working by looking for a green light on the device. If the light is on, it means the SPD is working fine. If the light is off, it means the SPD has failed and needs to be replaced ²³.
3. Please call 01952 971777 to arrange for a replacement
